< Business challenges Transformation Outcomes About IBM CIO Organization Next >

Business-critical apps

The Hybrid Cloud Platforms team within the IBM Chief Information Officer (CIO) Organization is responsible for delivering, securing and modernizing an immense, diverse IT environment that powers applications used by hundreds of thousands of IBMers every day. “We have a broad scope of responsibility for business-critical application infrastructure. Take, for example, our manufacturing applications. If those go down, IBM business comes to a halt. It’s the heart of our team supports,” explains Bob Epstein, Leader, IBM Manufacturing.

Hello! How can we help you?

The team’s mission is not just to keep the lights on. Their mission is to accelerate business transformation across IBM. “Our work to optimize IBM’s infrastructure is

essentially the cornerstone that enables everyone else to run fast and innovate in their role,” adds Melissa Santisteban, CIO Strategy Lead at IBM. The team is always looking for new ways to streamline and automate tedious, repetitive IT maintenance tasks that are required across the entire IT estate. They seek to eliminate drudgery and instead give their developers the time they need to contribute to transformational initiatives.

This is why the team relies on industry-leading technologies such as Red Hat® Ansible® Automation and why, when the Technical Preview of IBM® watsonx™ Code Assistant for Red Hat Ansible Lightspeed began, they volunteered to test out the solution.

Adopting automation, exploring AI

Before the technical preview program began, Epstein’s team was already relying on Red Hat Ansible Automation to support a wide range of tasks within their IT environment. “We use Ansible automations every single day, whether it’s through patching, resolving vulnerabilities or running regular health checks of our systems,” explains Epstein. When they began testing watsonx Code Assistant for Red Hat Ansible Lightspeed, Epstein’s team started by focusing on their existing use cases.

With watsonx Code Assistant for Red Hat Ansible Lightspeed, developers can build a task for an Ansible Playbook using natural language inputs. Once the input is submitted, the solution then offers suggestions on how to build that task.

“Our team of people who could produce Ansible Playbooks before the technical preview program began was around 10. Once the Enterprise Version of watsonx Code Assistant for Red Hat Ansible Lightspeed becomes Generally Available, we expect we would be able to ask our extended team to produce Ansible content because it will generate content recommendations based on natural language. We expect our pool of individuals who can produce this factor of 10,” says Epstein.

Driving modernization

During the technical preview of watsonx Code Assistant for Red Hat Ansible Lightspeed, the team was able to achieve 60% initial build of an Ansible Playbook using recommendations provided by watsonx.

“I like to look at our modernization journey in these stages: crawl, walk, run, fly. In the past, we were crawling, doing a lot of things manually. Then, when we started automating, we were walking. Once we implemented Red Hat Ansible, we were running. And as we look ahead, with watsonx Code Assistant for Red Hat Ansible Lightspeed, I think we will be able to fly,” adds Robert Barron, Architect, Hybrid Cloud Platforms, IBM CIO Organization. See how watsonx Code Assistant for Red Hat Ansible Lightspeed can help you fly.

Every company will have different use cases and will, therefore, experience different results. Client examples, like IBM's, are illustrative, but actual results will vary based on client configurations and conditions. Generally expected results cannot be provided as client results will depend on the data, systems and services used.

About IBM CIO Organization

The Chief Information Officer (CIO) Organization leads IBM's internal IT strategy and is responsible for delivering, securing, modernizing and supporting IBMers, clients and partners use to do their jobs every day. The organization encompasses creating an adaptive IT platform that makes the enterprise, accelerates problem-solving and serves as an innovation engine for IBM, catalyzing business growth.
